

Search — test cases and results

BytePe production · tests/regression/search.spec.js · run 6 Aug 2026 · logged out

7 TEST CASES	7 PASSED	0 FAILED	1 FINDING	5 NOT TESTABLE
-----------------	-------------	-------------	--------------	-------------------

In one line: search works, and its best matches are relevant. One thing worth raising: a search for *iphone* pads its dropdown with unrelated products, including a Samsung phone.

Test cases

PASS

SRCH-01 — Search box offers suggestions for a real product

Presence

Steps

1. Open <https://www.bytepe.com/all-products>
2. Click the search box in the header
3. Type "iphone"
4. Wait for the suggestion dropdown

Expected

The search box is visible and at least one suggestion appears.

Actual

20 suggestions appeared.

Proves the dropdown works, so the zero-result checks below mean "no match" rather than "search never ran".

PASS (with a finding)

SRCH-02 — Top suggestions for "iphone" are relevant

Correctness

Steps

1. Search for "iphone"
2. Read the first 5 suggestions

Expected

Each of the top 5 suggestions mentions "iphone".

Actual

Top 5 all iPhones. 13 of the remaining 15 do NOT mention iPhone.

The tail is padded with Apple accessories and drifts as far as "Galaxy Z Fold8 Ultra Samsung" and an Ambrane power bank. Not asserted, but logged every run so growth is visible.

PASS

SRCH-03 — Top suggestions for "apple" are relevant

Correctness

Steps

1. Search for "apple"
2. Read the first 5 suggestions

Expected

Each of the top 5 suggestions mentions "apple".

Actual

All 20 mention Apple. 0 tail drift.

Brand search works because each suggestion is labelled "<product> <brand>", so a brand term matches even when the product name does not contain it.

PASS SRCH-04 — Changing the term changes the suggestions **Behaviour**

Steps	1. Search "iphone" and note the suggestions 2. Search "galaxy" 3. Compare the two lists
Expected	The second list differs from the first and contains Galaxy products.
Actual	Lists differ; "galaxy" returns Galaxy products.

Replaces the requested pagination check. There is no results page, so there is no pagination — this asks the equivalent question of the control that does exist.

PASS SRCH-05 — Symbol-only search returns nothing and does not break the page **Negative**

Steps	1. Search "iphone" to prove the dropdown works 2. Search the currency symbol on its own 3. Check the catalogue is still on screen
Expected	Zero suggestions, page still usable, still on the products URL.
Actual	Zero suggestions. Catalogue still rendered.

Handled gracefully — no crash, no error page.

PASS SRCH-06 — Empty search does not navigate away **Negative**

Steps	1. Clear the search box 2. Press Enter 3. Check the URL and the page
Expected	No navigation, no suggestions, catalogue still visible.
Actual	URL unchanged, 0 suggestions, 12 product links still shown, no error message.

The site shows all products rather than an error. That is the behaviour being pinned, not a judgement that it is right.

PASS SRCH-07 — There is no search results page **Contract**

Steps	1. Search "iphone" and press Enter 2. Check whether the URL changed 3. Request /search?q=iphone directly
Expected	Enter does not navigate; /search returns 404.
Actual	Enter did not navigate. /search?q=iphone returned 404.

Deliberate guard. If a results page is ever added this test fails, which is the signal to revisit every "no results page" assumption in the spec.

The finding: relevance drift on "iphone"

The dropdown returns 20 suggestions. The first few are iPhones. The rest are padded with other stock:

Search term	Suggestions	Top 5 relevant	Tail not mentioning the term
iphone	20	Yes	13
apple	20	Yes	0

Examples from the "iphone" tail: *Galaxy Z Fold8 Ultra Samsung, Magsafe 10000 mAh Power Bank Ambrane, MacBook Neo Apple, Watch Series 11 Apple.*

Accessories may well be intentional. A Samsung phone for an iPhone query is harder to explain. The test does not fail on it — padding is plausibly deliberate — but it prints the tail count on every run, so if that 13 grows the drift is visible.

Requested, but nothing to test

Requested step	Why it is not covered
Verify search results page loads (URL contains /search)	No results page exists. Enter does not navigate; /search returns 404.
Verify ALL results contain the search term	Relevance is token-based. "samsung galaxy" returns 20 Galaxy products, none containing that literal phrase. Would fail on any multi-word query.
Click a result, then go back to search results	There is no results list to return to. Picking a suggestion goes straight to the product page.
Pagination through many results	No results page, so no pagination. The dropdown is capped at 20.
Empty search shows an error message	No error is shown. The catalogue stays on screen. Test pins actual behaviour.

How to run it

Command	Notes
<code>npx playwright test regression/search.spec.js --project=chromium</code>	No login needed. Creates nothing. ~24 seconds.
